on Crime and Criminal Justice  
in Asia and the Pacific

## REGIONAL OVERVIEW

2021

### KEY FACTS

(ASIA-PACIFIC REGION AS OF 2019)

**5.47 MILLION** PEOPLE IN PRISON IN ASIA-PACIFIC:  
A **41% INCREASE** BETWEEN 2000 AND 2019

### POPULATION COVERED

- **4.6 billion** people live in Asia-Pacific
- **60%** of the world's population

The population held in prisons **worldwide** has grown more than 25% between 2000 and 2019. In the **Asia and Pacific region**, home to approximately 60% of the world's population, the **prison population has increased more than 40%** during the same period, reaching 5.47 million people in 2019.

### TOTAL PRISON POPULATION

- **5.47 million** people are in prison in Asia-Pacific: **46%** of the world's prison population
- Between 2000 and 2019, the total prison population in Asia-Pacific has increased by **41%**

As the number of prisoners increase in a scenario of limited resources and competing priorities, implementing **policies that are effective to reduce crime** must be a priority for policymakers. Better policies require a clear understanding of the regional dynamics and the identification of best practices in each context. This is only possible with the collection of **reliable data** that can be used for **analysis** to inform decision-making.

### GENDER DISPARITIES

- More than **380,000 women** are in prison in the region
- Female incarceration has **increased** more compared to male incarceration (2000-2019)

The United Nations Office on Drugs and Crime (UNODC) collects crime and criminal justice data through the **UN-CTS (United Nations Surveys on Crime Trends and the Operations of Criminal Justice Systems)**. This analysis examines data collected from the period between **2000 and 2019** on prison population in countries in the Asia and Pacific region. As a large and diverse region encompassing more than 50 countries, dynamics and responses to crime vary widely, and no single measure can address its complexity. This analysis presents an overview of the region and investigates the overall trends of prison population in different subregions in the Asia and Pacific region.

### UNSENTENCED PRISONERS

- At least **1.1 million** unsentenced prisoners
- Approximately **1/3 of the world's** unsentenced prisoners are in Asia-Pacific

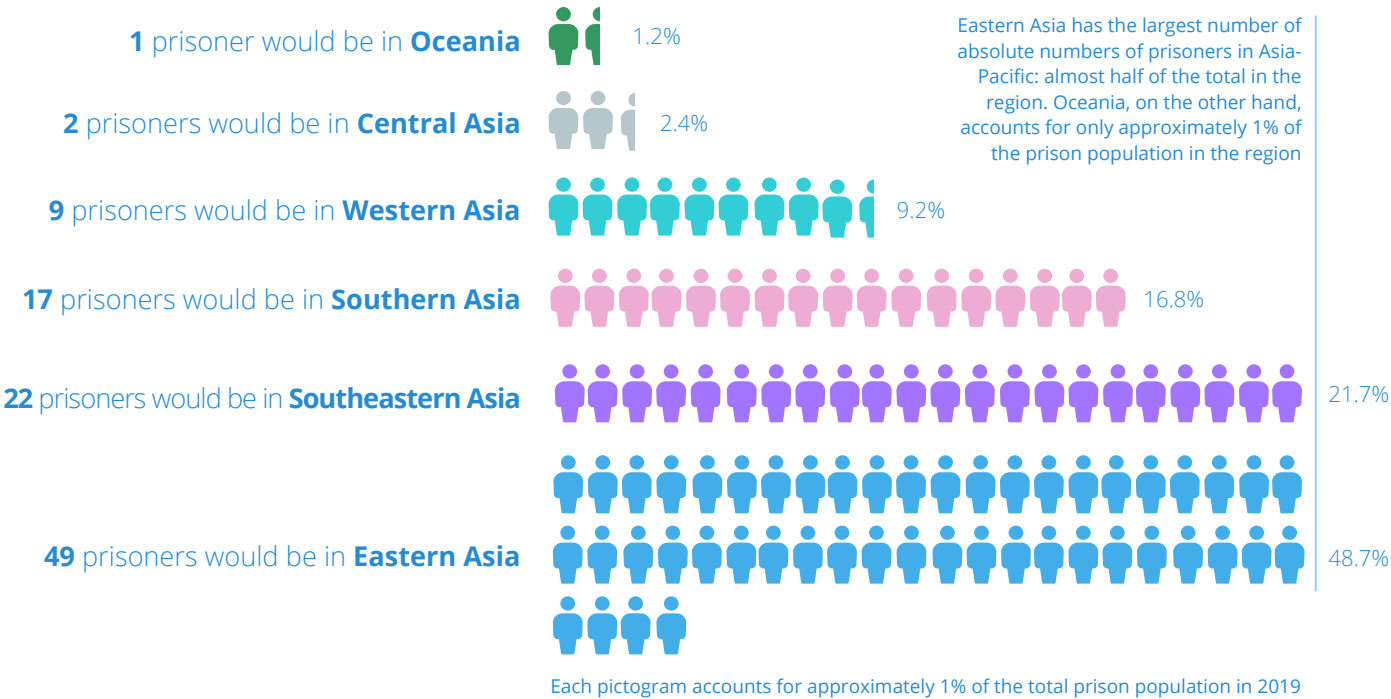

In the context of the **COVID-19 pandemic**, finding alternative solutions for detention and reducing prison overcrowding becomes even more critical to reduce the spread of the virus. Understanding the trends of prison population is an important first step to develop policies grounded on solid evidence.

**Data** can inform decisions that improve the distribution of resources per prisoner, enhance the effectiveness of the criminal justice system, ensure compliance to the Mandela Rules for Standard Minimum Rules for the Treatment of Prisoners and promote rule of law at the national and international levels.

# OVERVIEW | TOTAL PRISON POPULATION BY SUBREGIONS (2019)

The **5.47 million prisoners** in the Asia and Pacific region are not evenly distributed across its 6 subregions. Explore the below graphic to see how the different subregions contributed differently in 2019 to the total number of prisoners in Asia and Pacific.

If the total prison population in the **Asia and Pacific region** were comprised of **100 prisoners**, approximately...

# OVERVIEW | WORLD COMPARISON (2019)

However, comparisons using absolute numbers can be misleading due to the **different total population sizes** of subregions. While Oceania has a population of 42 million people, Eastern Asia, with 1.6 billion people, is 38 times larger. Since total population varies, it is expected that certain subregions will have more prisoners than others, due to the simple fact that they are home to more people.

One way to consider population differences is comparing the share that each subregion contributes to the **world prison population** and to the **total world population**. Compare the two bars to identify if the prison population in 2019 was expected or not considering the share of the total population of the subregion.

# OVERVIEW | SUBREGIONAL IMPRISONMENT RATES (2019)

A more reliable measure for comparing imprisonment between different subregions is the **imprisonment rate**, which is adjusted to the population size. See below how this number is calculated and why it is important.

IMPRISONMENT  
RATE

=

PRISON POPULATION  
OF THE SUBREGION  
  
TOTAL POPULATION  
OF THE SUBREGION

X

100,000

This simple formula gives us a measure that facilitates comparisons between different subregions. The imprisonment rate is a measure of prison population **proportional to the total population of the subregion**, allowing direct comparison adjusted to the different population sizes.

## SDG 16 indicator 16.3.2. Unsentenced Detainees as a Proportion of Overall Prison Population

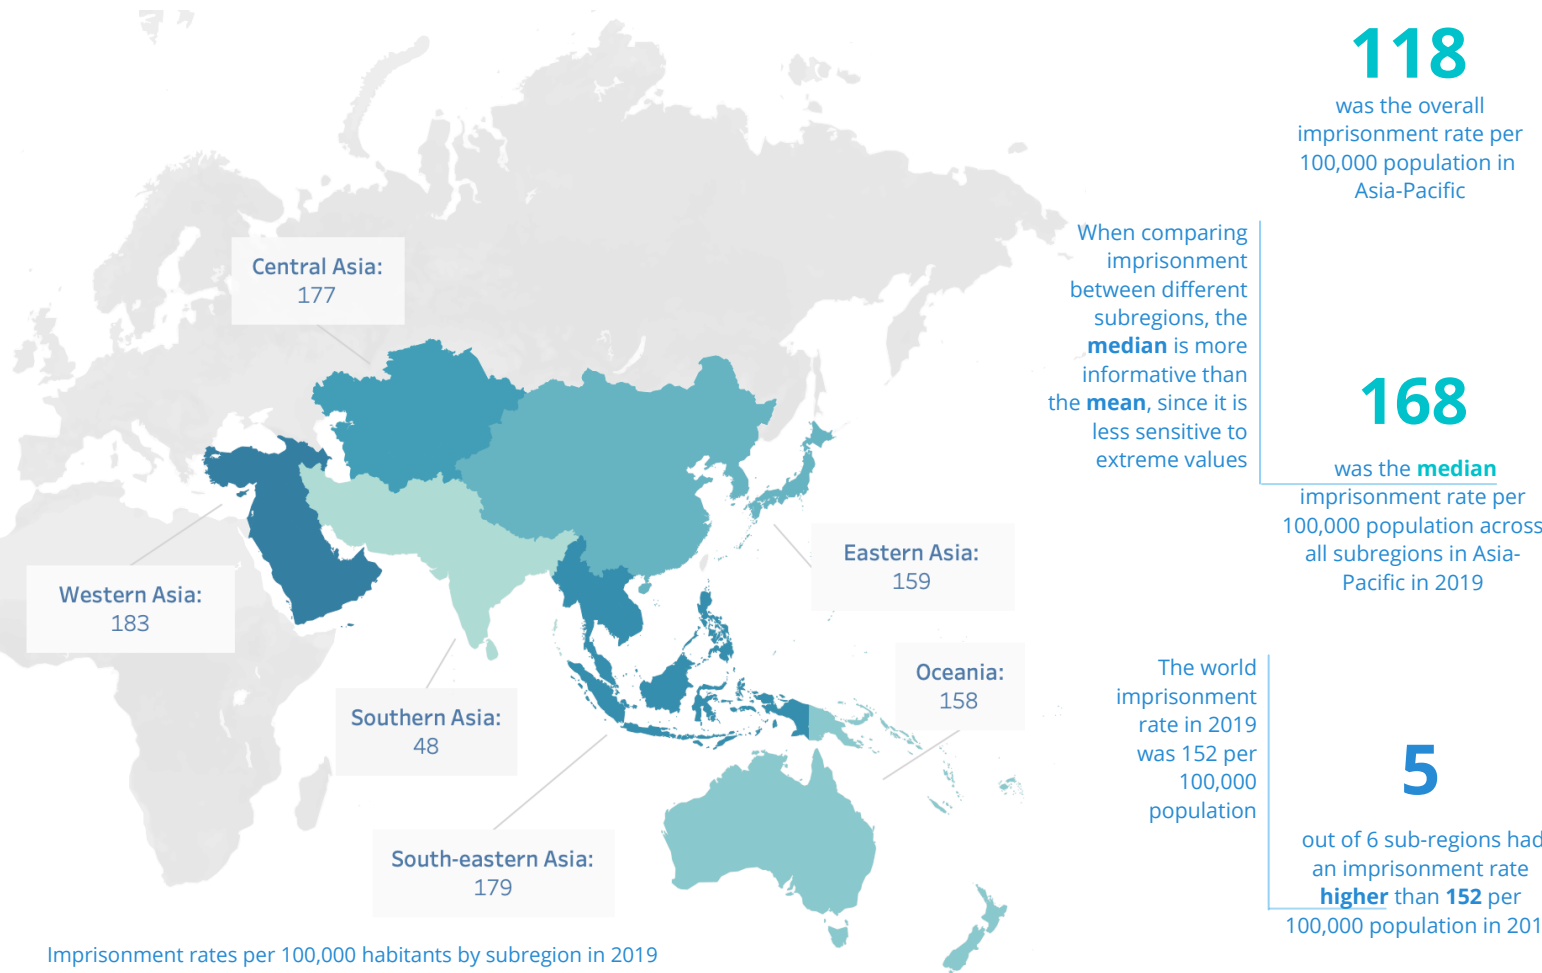

As part of the global commitment towards achieving the Sustainable Development Goals, the collection of data on imprisonment allows us to compute the indicator **16.3.2**. This information can then be used to measure progress towards the promotion of rule of law and equal access to justice in countries, as well as for enhancing national understanding and channeling resources in a more rational manner.

The map below shows the sharp differences in imprisonment in different subregions of the Asia and Pacific region. In 2019, the overall imprisonment rate per 100,000 in Asia-Pacific was **118**, a number lower than the world total (152).

However, this does not mean that imprisonment rates are lower everywhere in Asia-Pacific when compared to the rest of the world. In fact, 5 out of 6 sub-regions have imprisonments rates **higher** than the world total.

The overall imprisonment rate is affected by variations between the sub-regions. For example, the low rate observed in Southern Asia influences the overall measure, hiding substantial differences between subregions.

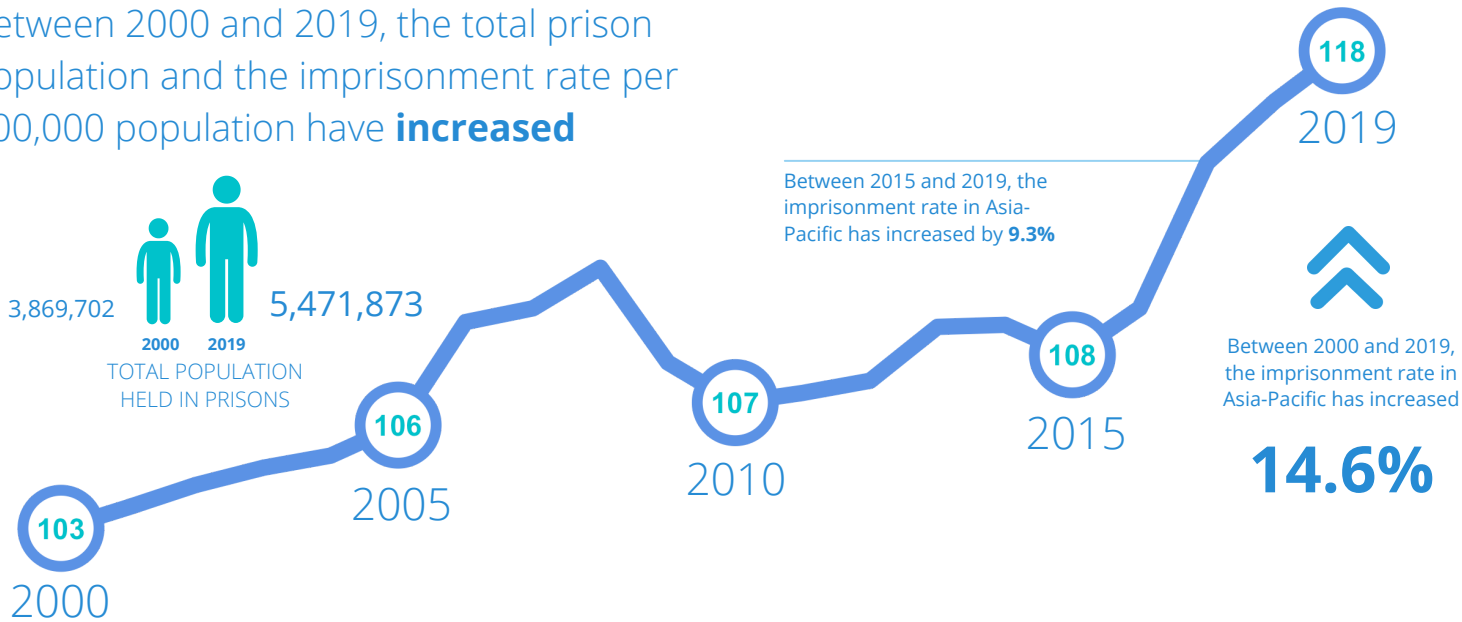

This highlights the importance of carrying out **analysis and comparisons at the subregional level**, especially in a large, diverse and complex region such as Asia-Pacific. Explore the below map to see the subregional differences in imprisonment rates.

Imprisonment rates per 100,000 habitants by subregion in 2019

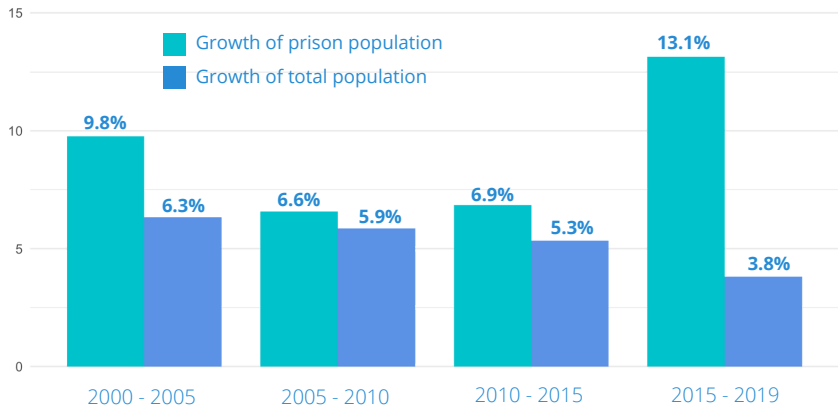

# HISTORICAL TRENDS | REGIONAL ANALYSIS (2000-2019)

Between 2000 and 2019, the total prison population and the imprisonment rate per 100,000 population have **increased**

Between 2000 and 2019, the total prison population in Asia-Pacific has increased more than **40%**. The line chart above shows the values adjusted for population growth (imprisonment rate per 100,000). Between 2000 and 2019, the rate has increased by **14.6%**: from 103 to 118. If we look at the most recent years, from 2015 to 2019, the increase is **9.3%**. This indicates that, in the last two decades, **the prison population in Asia-Pacific has grown at a faster pace than the overall population growth in the region.**

The bar chart below compares side by side the growth of **prison population** to **total population (including prisoner and non-prisoner population)** in the region (by five-year periods). By comparing the differences between the sizes of the bars, we identify that prison population growth has been outpacing total population growth.

This suggests that **imprisonment is accelerating in recent years**. People in Asia-Pacific are being sent to prison at a higher rate today than in 2000, and at an increasingly faster pace during the last **five years**.

# HISTORICAL TRENDS | DISAGGREGATION

The UN-CTS data has several levels of disaggregation, providing important details on subpopulations that can inform decision making. Two examples of disaggregation are presented here.

← Although the total female population in prisons is still small compared to the male one, there has been a substantial increase in female imprisonment rates in the past two decades.

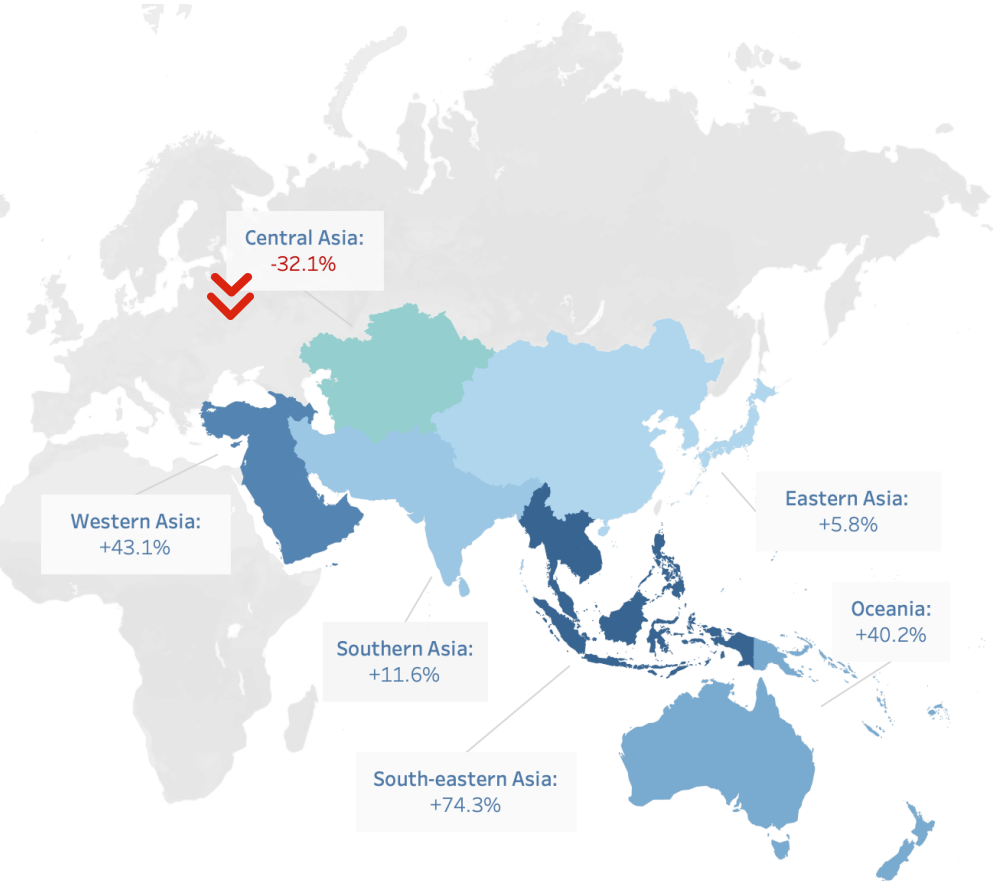

→ In 2019, the proportion of unsentenced detainees varied significantly between different subregions

Between 2000 and 2019, the female imprisonment rate per female population has **increased by 36.3%**, higher than for males.

Oceania is excluded due to limited data coverage on gender disaggregation.

# HISTORICAL TRENDS | SUBREGIONAL ANALYSIS (2000-2019)

Almost all subregions showed an increase in the imprisonment rate between 2000 and 2019, but the increase has not been the same. The map on the left and the bar charts below compare the changes to the imprisonment rates by subregions between 2000 and 2019.

Change in imprisonment rates per 100,000 habitants by subregion between 2000 and 2019.

## CHANGE IN IMPRISONMENT RATES BY SUBREGION

The line chart below helps us visualize the **ups and downs of imprisonment rates in the different subregions** in the last two decades. Visualizations such as this can help us see fluctuations in time series that might otherwise be hidden by single measures. In order to have additional insights into the possible underlying patterns in the data, we can carry out several **statistical tests**. For identifying the existence of linear trends over the period, the Mann Kendall test was conducted.

The **results** of the Mann Kendall test showed an increasing trend for 4 subregions (Oceania, South-eastern Asia, Southern Asia, and Western Asia), a decreasing trend for Central Asia, and no trend for Eastern Asia.

Although indicative of certain patterns, these results must be contextualized and can only be interpreted within the specificities of each subregion.

Imprisonment rates per 100,000 population by subregion between 2000 and 2019.

### Methodology note

*Data:* The data used for this document was provided by Member States and collected and validated by UNODC through the UN-CTS (Survey of Crime Trends and Operations of Criminal Justice Systems). Subregional estimates were developed by UNODC HQ. The dataset is publicly available at the UNODC data portal ([dataunodc.un.org](http://dataunodc.un.org)).

*Geographic classification:* For subregional classification, the analysis used the United Nations M49 system. The following subregions are classified under Oceania: Australia and New Zealand, Melanesia, Micronesia, and Polynesia.

### Acknowledgements

The CoE Regional Snapshot is a publication by the Crime Research and Methodology Unit (CRMU) of the United Nations Office on Drugs and Crime (UNODC) and Statistics Korea (KOSTAT) Centre of Excellence for Statistics on Crime and Criminal Justice in Asia and the Pacific. The publication was developed with technical assistance from the Research and Trend Analysis Branch (RAB) of UNODC Headquarters.

### General coordination
